 intro to vectors and scalars
 p39-40 q 33,41,43,44,46,57

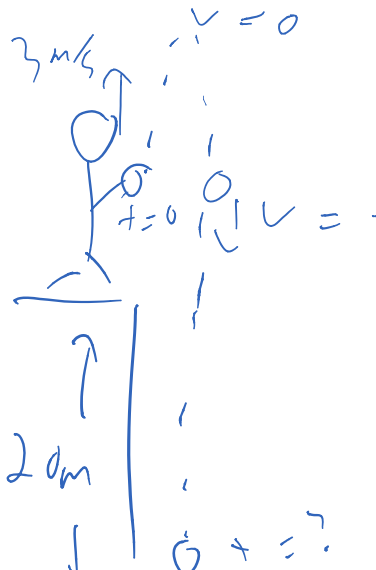

Diagram showing a person jumping from a height of 20m. The initial velocity is 3 m/s upwards. The velocity at the top is 0, and the velocity at the bottom is -3 m/s. The time to reach the top is $t=0$, and the time to reach the bottom is $t=?$.

$$d = \frac{1}{2}at^2 + V_i t$$

$$(-20m) = \frac{1}{2}(-9.8m/s^2)t^2 + 3m/s t$$

$$ax^2 + bx + c = 0$$

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$-4.9t^2 + 3t + 20 = 0$$

$$t = \frac{-3 \pm \sqrt{9 - 4(-4.9)20}}{2(-4.9)}$$

$$t = \frac{-3 \pm 20.02}{-9.8}$$

$$t = \frac{23.02}{-9.80} = 2.3495 s$$

$$= \boxed{2.35 s}$$

$$f) V_f = ?$$

$$V_f^2 = V_i^2 + 2ad$$

$$V_f^2 = (3.0 \text{ m/s})^2 + 2(-9.8 \frac{\text{m}}{\text{s}^2})(-20 \text{ m})$$

$$V_f^2 = 9.0 \text{ m}^2/\text{s}^2 + 392 \text{ m}^2/\text{s}^2$$

$$V_f^2 = 401 \text{ m}^2/\text{s}^2$$

$$V_f = \pm 20.0 \text{ m/s}$$

$$V_f = -20.0 \text{ m/s}$$

$$e) +_{up} + +_{down}$$

$$f) V_f^2 = \cancel{V_i^2} + 2a(d+h)$$

p37

Questions

1 speed - doesn't give the direction
speedometer and compass could
give velocity

3 yes - might be positive and negative
velocities cancelling out.

or net displacement can be zero,

running around a track

5 if velocity is constant, then both speed and direction are constant.

on the other hand, if the speed is constant, the direction can change, and therefore the velocity, and acceleration

7 yes, when you just start to fall, or when you change direction smoothly
projectile thrown straight up, at the top the speed is zero while the acceleration is -9.80m/s^2

9 $a = \text{change in } v/t$ both have the same change, 10 km/h in the same time.

q27

$$a = -6.0 \text{ m/s}^2 \quad \leftarrow \text{Brake}$$

$$a = \frac{20 \text{ km/h} - 50 \text{ km/h}}{7.0 \text{ s}} \quad \leftarrow \text{gives it}$$

$$\approx 0.7937 \text{ m/s}^2$$

$$\text{gives } \begin{cases} d = 30 \text{ m} \\ a = 0.7937 \text{ m/s}^2 \\ t = ? \\ v = 13.9 \text{ m/s} \end{cases}$$

$$\left. \begin{array}{l} t = ? \\ v_i = 13.9 \text{ m/s} \end{array} \right\}$$

$$d = \frac{1}{2} a t^2 + v_i t$$

$$30 = \frac{1}{2} (0.7937) t^2 + 13.9 t$$

$$d = \frac{1}{2} (0.7937) (2)^2 + 13.9 (2)$$

$$= 29.347 \text{ m}$$

$$= \boxed{29 \text{ m}} \quad \text{Nope ticket or accident}$$

Brakes

$$a = -6 \text{ m/s}^2$$

$$v_f = 0$$

$$v_i = 13.9 \text{ m/s}$$

$$t = ?$$

$$v_f = v_i + a t$$

$$0 = 13.9 \text{ m/s} + (-6 \text{ m/s}^2) t$$

$$t = \frac{-13.9 \text{ m/s}}{-6.0 \text{ m/s}^2}$$

$$= 2.316 \text{ s}$$

$$v_f^2 = v_i^2 + 2 a d$$

$$0 = (13.9)^2 + 2 (6) d$$

$$d = \frac{17.9^2}{12}$$

$$d = 16 \text{ m}$$

last class

e) $V_i = 0$

$$a = -9.8 \text{ m/s}^2$$

$$d = 20 \text{ m} + h$$

$$d = \frac{1}{2} a t^2$$

$$t_{\text{down}} = \sqrt{\frac{2(20.46)}{9.8}} = 2.0434 \text{ s}$$

$$V_f = V_i + a t$$

$$t = \frac{0 - 3}{-9.8} = 0.3061 \text{ s}$$

$$t = 2.0434 + 0.3061$$

$$= \boxed{2.35 \text{ s}}$$

$$d = -20 \text{ m} \quad t = ?$$

$$a = -9.8 \text{ m/s}^2 \quad V_i = 3.0 \text{ m/s}$$

$$d = \frac{1}{2} a t^2 + V_i t$$

$$-20 = \frac{1}{2} (-9.8) t^2 + 3t$$

$$a x^2 + b x + c = 0 \quad x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

$$-4.9 t^2 + 3t + 20 = 0$$

$$t = \frac{-3 \pm \sqrt{9 - 4(-4.9)(20)}}{2(-4.9)}$$

$$t = \frac{-3 \pm \sqrt{401}}{-9.8}$$

$$\frac{-3.02002}{-9.80}$$

$$t = 2.35 \text{ s}$$

3.6

$$f) v_f^2 = v_i^2 + 2ad$$

$$v_f = \pm \sqrt{401 \text{ m}^2/\text{s}^2}$$

$$v_f = -20.0 \text{ m/s}$$

p37

question 1

speed, no direction

velocity use the speedometer
and a compass

Q3 average velocity = 0 if
instantaneous v = not 0?

If you change direction, the
velocity can be negative and
positive and cancel out.

or $d=0$ if you return to the
same point (go around the
track)

Q5 No, velocity is speed with
direction so if the velocity is
constant the speed is
constant.

The components of velocity
could be constant while the
speed changes.

But if the speed is constant
the velocity can change
because the direction
changes.

Q7 Yes, you throw an object
straight up, the velocity at the
top is zero while the
acceleration is -9.80 m/s^2 .

g = gravitational field strength
 = 9.80 N/kg

Q9 a = change in $v/t = 90-80=$
 10

= $10-0=10$

they have the same
 acceleration

$$t = 2.0 \text{ s}$$

Brakes $a = -6.0 \text{ m/s}^2$

guns $\frac{v_f - v_i}{t} = 0.79 \text{ m/s}^2$

$$d = \frac{1}{2}at^2 + v_i t$$

p39-40 q 33,41,43,44,46,57

Diagram of a person jumping from a height h . The person starts at $v=0$ and falls down. The distance from the starting point to the ground is h . The person's initial velocity is 0 m/s . The acceleration is $a = -9.80 \text{ m/s}^2$. The final velocity is -3 m/s .

e) $t = ?$

$$d = \frac{1}{2}(v_i + v_f)t$$

solve first

$$d = \frac{1}{2}at^2 + v_i t$$

$t_{\text{up}} + t_{\text{down}}$

0.306 s

$$d = \frac{1}{2}at^2$$

$$t = \sqrt{\frac{2(20.48)}{9.8}}$$

$$t = 2.04 \text{ s}$$

total $t = 0.306 \text{ s} + 2.04 \text{ s}$

$$= 2.35 \text{ s}$$

$$\begin{aligned}
 d &= \frac{1}{2} a t^2 + v_i t \\
 -20 &= \frac{1}{2} (-9.8) t^2 + 3t \\
 a x^2 + b x + c &= 0 \quad -4.9 t^2 + 3t + 20 = 0 \\
 x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\
 t &= \frac{-3 \pm \sqrt{9 - 4(-4.9)20}}{2(-4.9)} \\
 t &= \frac{-3 \pm \sqrt{401}}{-9.8} = \frac{-3 \pm 20.01}{-9.8} \\
 &= \frac{-23.01}{-9.8} = \boxed{2.35 \text{ s}}
 \end{aligned}$$

$$\begin{aligned}
 f) \quad v_f^2 &= v_i^2 + 2a\Delta y \\
 &= 0 + 2(-9.8)(-20) \\
 v_f^2 &= 9 + 2(-9.8)(-20) \\
 \boxed{v_f} &= \boxed{-20.0 \text{ m/s}}
 \end{aligned}$$

$$\begin{aligned}
 t &= \frac{d}{\frac{1}{2}(v_i + v_f)} = \frac{-20}{\frac{1}{2}(3 - 20.0)} \\
 t &= \frac{-20}{\frac{1}{2}(-17)} = \boxed{2.35 \text{ s}}
 \end{aligned}$$

p37

question 1

speed is a scalar - no direction

velocity is a vector

speedometer only gives speed

speedometer and a compass

you would have velocity

question 3

yes, if you end where you began, the displacement is zero so the average velocity is zero even though the instantaneous velocity at any point is non-zero

Q 5 No, because velocity is speed with direction, so if velocity is constant, the speed and direction are constant, so the speed is constant.

can the speed be constant with a changing velocity?

yes- if the direction is changing
- uniform circular motion

Q7 yes, if you throw an erasure straight up, at the top point the velocity is zero while the acceleration is -9.80m/s^2 .

q9 $a = \text{change in velocity} / \text{time}$

same change in v (10 km/h)
and the same time, the
acceleration would be the same

$$d = v_i t + \frac{1}{2} a t^2$$

$$\text{time to stop} = (v_f - v_i) / a$$

$$= -13.9 / -6 = 2.3167 \text{ s}$$

$$d = 13.9(2.3167) + \frac{1}{2} (-6) (2.3167)^2 = 16.1 \text{ m} - \text{lots of room}$$

$$d = 13.9 \text{ m/s} (2 \text{ s}) + \frac{1}{2}$$

$$(0.79 \text{ m/s}^2)(2 \text{ s})^2 = 29.4 \text{ m}$$

she doesn't enter the intersection before the light turns red.

ticket or accident
